PROFESSIONAL USE

What is a chemical peeling?

It is a professional use procedure that, by applying topically a chemical solution, produces a controlled regeneration of the skin's surface to improve imperfections, as well as the texture, tone, and luminosity of the skin.

The acid used, its pH, and the percentage of its formulation make possible a deeper skin renewal than a traditional exfoliation, providing the skin with a much more uniform and healthy appearance, stimulating the natural production of collagen, and working against the first signs of ageing.

After an initial skin diagnosis, the professional will adapt the guideline depending on the need and the objective of the treatment (skin with acne, melasma, solar damage, wrinkles, flaccidity, etc.).

Is it an uncomfortable procedure?

Each patient responds differently, but you could perceive a temporary sensation of stinging or heat that would disappear gradually. It is recommended to use afterwards cosmetics that hydrate deeply, soothe, and regenerate the treated area, as well as a daily high sun protection.

Who is it aimed at?

Undergoing a chemical peeling is not only for a matter of age but also for treating the condition of the skin. It can be carried out on people who wish to improve and correct skin imperfections. Thanks to the concentration of powerful acids, its effect is more visible and lasting.

What to take into account?

- If you are pregnant.
- Extremely sensitive or reactive skin.
- Inflammatory, infectious, allergic, or eruptive processes or any skin condition.
- Avoid intense sun exposure before (24 h) and after (48 h).

Is a recovery time necessary?

Expert Lab Chemical Peel is a range of peelings with superficial action depth, that is, less abrasive, it produces a gentle exfoliation, so no recovery time is needed. Occasionally, there may be a light reddening or momentary desquamation, common in this type of procedures.
